Before the interview

We need you to complete the following tasks and bring this setup for the technical interview.

1. ## Project Setup

   Please create a basic project in the language that you prefer with the tools (IDE, CLI, etc) of your convenience.

2. ## Split method

   Please provide, in the same project, a split method implementation (do not use std lib) that meets the following signature:

   ```
   split(string, delimiter): string[]
   ```

   The split(string, delimiter) method splits a string into an array of strings by separating the string into substrings, using a specified delimiter string to determine where to make each split.

   e.g.
   ```
   split("a,b,c", ",") // ["a", "b", "c"]
   split("abcbd", "bc") // ["a", "bd"]
   ```
